Percentages of people with HIV engaged in selected stages of the continuum of care—Minnesota, 2017

- Defined as people undiagnosed (estimate 1,000 [600-1,400], 95% CI) and people diagnosed (n=8580) aged 13 or more with HIV infection (regardless of stage at diagnosis) through year-end 2016, who were alive at year-end 2017.
- Defined as people diagnosed aged 13 or more with HIV infection (regardless of stage at diagnosis) through year-end 2016, who were alive at year-end 2017.
- Calculated as the percentage of people linked to care within 30 and 90 days after initial HIV diagnosis during 2016. Linkage to care is based on the number of people diagnosed during 2016 and is therefore shown in a different color than the other bars with a different denominator.
- Calculated as the percentage of people who had ≥1 CD4 or viral load test results during 2017 among those diagnosed with HIV through year-end 2016 and alive at year end 2017.
- Calculated as the percentage of people who had suppressed viral load (≤200 copies/mL) at most recent test during 2017, among those diagnosed with HIV through year-end 2016 and alive at year end 2017.
- Calculated as number of people who had suppressed VL (≤200 copies/mL) at most recent test during 2017, among those who were retained in care during 2017 (5,508/6,243).
