STD Surveillance System

http://www.health.state.mn.us/divs/idepc/dtopics/stds/stats/index.html
• Under Minnesota law, physicians and laboratories must report all laboratory-confirmed cases of chlamydia, gonorrhea, syphilis, and chancroid to the Minnesota Department of Health (MDH) within one working day.

• MDH does not maintain statistics for other, non-reportable STDs (ex: herpes, HPV/genital warts).

• This slide set describes trends in reportable STDs in Minnesota by person, place, and time.

• Analyses exclude cases reported from federal and private prisons.
STD surveillance is the systematic collection of data from cases for the purpose of monitoring the frequency and distribution of STDs in a given population.

STD surveillance data are used to detect problems, prioritize resources, develop and target interventions, and evaluate the effectiveness of interventions.
Factors that impact the completeness and accuracy of STD data include:

- Level of STD screening by healthcare providers
- Individual test-seeking behavior
- Sensitivity of diagnostic tests
- Compliance with case reporting
- Completeness of case reporting
- Timeliness of case reporting

Increases and decreases in STD rates can be due to actual changes in disease occurrence and/or changes in one or more of the above factors.
• The surveillance system only includes cases with a positive laboratory test. Cases diagnosed solely on symptoms are not counted.

• Since 2012 we have included cases that had only a lab report and no corresponding case report form. This has increased the number of unknowns in some variables.

• In 2016, in order to be consistent with CDC, we categorized all White, Hispanic and Black, Hispanic cases as Hispanic. That means the race categories now reflect only White, Non-Hispanic and Black, Non-Hispanic cases.

• Surveillance data represent cases of infection, not individuals. A person with multiple infections in a given year will be counted more than once.

• Caution is warranted when interpreting changes in STD numbers that can seem disproportionately large when the number of cases is small.
Chlamydia — Rates of Reported Cases by State
United States and Outlying Areas, 2016

NOTE: The total rate of reported cases of chlamydia for the United States and outlying areas (Guam, Puerto Rico, and Virgin Islands) was 494.2 cases per 100,000 population.
NOTE: The total rate of reported cases of gonorrhea for the United States and outlying areas (Guam, Puerto Rico, and Virgin Islands) was 144.4 cases per 100,000 population.
Primary & Secondary Syphilis — Rates of Reported Cases by State
United States and Outlying Areas, 2016

NOTE: The total rate of primary and secondary syphilis for the United States and outlying areas (Guam, Puerto Rico, and Virgin Islands) was 8.7 cases per 100,000 population.

*Includes persons reported with more than one race
What’s Being Done in Minnesota?

• The MDH Partner Services Program continues to follow up on early syphilis cases and their sex partners and all pregnant syphilis cases.

• All HIV/Syphilis co-infected cases are assigned to Partner Services for follow-up.

• Physicians are encouraged to screen men who have sex with men at least annually and to ask about sex partners.

• All pregnant females should be screened for syphilis at first prenatal visit, 28 weeks’ gestation (at minimum 28-36 weeks), and at delivery.
• From 2007-2017, the chlamydia rate increased by 71%. The rate of gonorrhea increased by 84%. Rates of reported syphilis increased in 2017 compared to 2016 by 10%.

• Minnesota has seen a resurgence of syphilis over the past decade, with men who have sex with men and those co-infected with HIV being especially impacted. However, the number of females is near the record high for the last decade.

• Persons of color continue to be disproportionately affected by STDs.

• STD rates are highest in the cities of Minneapolis and Saint Paul. However, chlamydia and gonorrhea cases in the Twin Cities suburbs and Greater Minnesota account for 62% of the reported cases in 2017.

• Between 2016 and 2017, early syphilis cases increased by 9%. Men who have sex with men comprised 83% of all male cases in 2017; cases among women are continuing to rise.
Future Updates to STD Reporting and Current Follow-Up

• New case report form to accommodate changes in treatment guidelines, requesting HIV testing status, and PrEP (Pre-Exposure Prophylaxis) usage.

• Case report form is be able to be filled out on a computer and printed to be mailed or faxed in

• All cases co-infected with HIV (diagnosed in the last year)/Gonorrhea, HIV/Syphilis, and Early Syphilis will be continue to be assigned to MDH Partner Services for follow-up

• All Gonorrhea cases continue to have the potential for being contacted by MDH for additional follow-up
