Response to MDH statement on research

MDH repeatedly has implied that all scientific research finds that vaccinations are extremely safe. For example, one statement from the MDH rebuttal said:

The evidence shows that serious adverse reactions from vaccines are extremely rare. As Dorit Reiss wrote, "The fact that a parent believes a child's problems stem from a vaccine is relevant, but often not sufficient, especially when the research goes the other way."

The implication is that all scientific research points to one monolithic conclusion: "that serious adverse reactions from vaccines are extremely rare."

"The research" is in fact, full of evidence of serious adverse reactions. Here is a link to a website with hundreds of studies documenting adverse reactions to vaccines:

Doctors and Scientists With Concerns About Vaccine Safety

The following is a list of scientists and physicians who acknowledge that vaccines can and do harm some children and/or have some concern about a vaccine, combinations of vaccines, the vaccine schedule, or an ingredient or ingredients in vaccines. These professionals are not anti-vaccine (though some of the medical doctors are) rather they recognize that vaccines, like all pharmaceutical products, carry risks. They also know that scientific inquiry should never cease.

All of these have either published research that explores safety issues relating to a vaccine, the vaccine schedule, a combination of vaccines or ingredients in vaccines, or have spoken publicly about their concerns.

This list was created by Leslie Manookian of *The Greater Good* in collaboration with Anne Dachel of Age of Autism.
