

Your Health and Vapor Intrusion

RESIDENTIAL

The amount of chemicals that enter buildings from contaminated soil vapor are typically not high enough to affect most people's health. However, the risks may be greater when people are exposed to high amounts of some chemicals for a long time, or if exposed people are sensitive or their health is compromised.

Examples of people who may be sensitive include:

- women who are pregnant or may become pregnant
- infants and young children
- elderly people
- people who are living with chronic disease or a compromised immune system

MDH is especially concerned about women in their first trimester when the contaminant trichloroethylene (TCE) is present.

If you have concerns about anyone living in your home or building who may be a sensitive individual, please contact MDH. Personal or health information you share with MDH is confidential. If you contact us, we may be able to:

- speed up sampling or building mitigation
- share what we know about health risks
- suggest actions to reduce potential exposure
