DEPARTMENT OF HEALTH

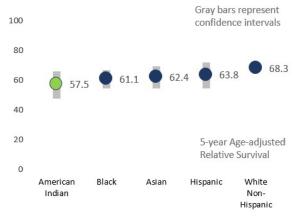

Colorectal Cancer Disparities in Minnesota

Colorectal cancer (CRC) is the third leading cause of cancer deaths in Minnesota for both men and women.

American Indians are more likely to be diagnosed (incidence) and die (mortality) from CRC than others in Minnesota.

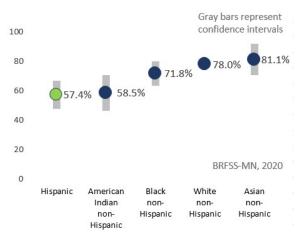

American Indians are least likely to survive five years after diagnosis.

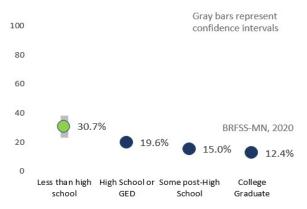

57.5% of American Indians will survive their colorectal cancer five years after diagnosis.

In 2020, Hispanics aged 50-75 were least likely to have received one or more of the recommended CRC screening tests within the recommended time interval.

57% of Hispanics aged 50-75 received a CRC screening, compared to 81% of Asians.

In 2020, Minnesotans with **less than a high school education** were over twice as likely as college graduations to have **never received any of the recommended CRC screening tests**.

Almost 31% of Minnesotans with less than a high school education have not been screened for CRC.
