Antibiotic Use Attitudes and Beliefs Survey Cover Letter Template for Nurses

«<mark>Date</mark>»

«Mr. / Ms.» «First_Name» «Last_Name» «Address» «City», «State» «ZIP»

Dear «Mr. / Ms.» «Last_Name»:

«Facility Name» is conducting an anonymous survey about infections and antibiotic use in long-term care facilities; your participation is kindly requested.

While I strongly support this effort, I am very aware of the constraints on your time. Only the most pertinent survey questions are included; the survey will take less than 15 minutes to complete. Please answer the questions as honestly and completely as possible.

Please return your completed survey to «location» by «date 2 weeks from distribution». Thank you in advance for your participation!

If you have any questions about the survey please don't hesitate to contact «<mark>Name</mark>» at «phone number and/or email address</mark>».

Sincerely,

«Name», «Credentials» Director of Nursing «Facility»

Enclosure: Antibiotic Use Attitudes and Beliefs: Nursing Survey

Antibiotic Use Attitudes and Beliefs: Nursing Survey

1. Please check your current role: 🗌 RN 🛛 LPN 🔲 Other:

2. How many years have you been working in a long-term care facility? \Box 0-5 \Box 6-10 \Box 11-20 \Box More than 20

The following are questions about antibiotic use and urinary tract infections.

3. When selecting a response that most accurately reflects your opinion regarding antibiotic use, please choose from the following options: 'antibiotics rarely contribute,' 'antibiotics sometimes contribute,' or 'antibiotics often contribute.'

I believe that using antibiotics contributes to:

	Rarely	Sometimes	Often
3a. Diarrhea in the person taking antibiotics	\bigcirc	\bigcirc	0
3b. Future resistance to antibiotics	\bigcirc	0	\bigcirc
3c. Reduced rates of influenza	0	0	\bigcirc
3d. High quality care	0	0	0
3e. Interaction with other medications	\bigcirc	0	\bigcirc
3f. Rash	0	0	0
3g. Family perception of high quality care	0	0	\bigcirc

4. When selecting a response that most accurately reflects your opinion about when antibiotics are appropriate for a resident **WITH** an <u>indwelling catheter</u> and **ONLY** the following symptoms/findings, please choose from the following options: 'rarely appropriate,' 'sometimes appropriate,' or 'often appropriate.'

	Rarely	Sometimes	Often
4a. Resident with foul-smelling urine	\bigcirc	\bigcirc	\bigcirc
4b. Resident with bacteria in urine	0	0	0
4c. Resident with bacteria and white blood cells (WBC) in urine	0	0	0
4d. Change in functional status and family concern about a possible infection	0	0	0
4e. New confusion and history of urinary tract infection (UTI)	0	0	0
4f. Positive influenza rapid test	0	0	0

4g. Cough and green or yellow nasal discharge	0	\bigcirc	\bigcirc
---	---	------------	------------

5. When selecting a response that most accurately reflects your opinion about when antibiotics are appropriate for a resident **WITHOUT** an <u>indwelling catheter</u> and **ONLY** the following symptoms/findings, please choose from the following options: 'rarely appropriate,' 'sometimes appropriate,' or 'often appropriate.'

	Rarely	Sometimes	Often
5a. Resident with foul-smelling urine	\bigcirc	\bigcirc	\bigcirc
5b. Resident with bacteria in urine	0	0	0
5c. Resident with bacteria and white blood cells (WBCs) in urine	0	0	0
5d. Change in functional status and family concern about a possible infection	0	0	\bigcirc
5e. New confusion and history of urinary tract infection (UTI)	0	0	\bigcirc
5f. Positive influenza rapid test	0	0	\bigcirc
5g. Cough and green or yellow nasal discharge	0	0	0

6. When selecting a response that most accurately reflects your opinion about when action should be taken, please choose from the following options: 'rarely take the following action,' 'sometimes take the following action,' or 'often take the following action.'

When assessing an otherwise stable and alert resident with a fever, no other complaints, and a history of urinary tract infections (UTIs), would you:

	Rarely	Sometimes	Often
6a. Increase frequency of monitoring vital signs	\bigcirc	\bigcirc	\bigcirc
6b. Obtain an order for urinalysis and culture	\bigcirc	0	\bigcirc
6c. Recommend this resident receive antibiotics	0	0	0
6d. Review resident history and symptoms	0	0	0
6e. Review resident's current medications	0	0	0
6f. Encourage fluids (if no fluid restrictions)	0	0	0
6g.Recommend this resident be evaluated in an Emergency Department (ED) / clinic	0	0	0

7. When selecting a response that most accurately reflects your beliefs about ways to prevent the spread of diseases, please choose from the following options: 'disagree,' 'neutral,' or 'agree.'

	Disagree	Neutral	Agree
7a. I don't have to change gloves between resident rooms if I am just emptying Foley bags.	0	\bigcirc	0
7b. I only need to remove gloves when they look dirty.	0	\bigcirc	\bigcirc
7c. Flu can be spread to others before the infected person has symptoms of influenza	0	0	0
7d. You can get the flu from the flu shot.	0	0	0

- 8. **Scenario:** A resident has cloudy, foul-smelling urine; is agitated; slightly more confused than baseline; and has a history of UTI; T = 99.1°F. What would you do? (Circle all that apply)
 - a. Recommend this resident receive antibiotics
 - b. Document resident status and continue to monitor
 - c. Contact the provider for an order to send a urine specimen to the lab for a urinalysis (UA) / urine culture (UC)
- 9. I believe antibiotics are effective against infections caused by viruses such as influenza ("flu"). _____ True or _____ False
- 10. I believe that other than an allergy to an antibiotic, there are no side effects to taking antibiotics. ____ True or ____ False
- 11. When selecting a response that most accurately reflects your beliefs about *Clostridium difficile* (*C. diff*) infection, please choose from the following options: 'disagree,' 'neutral,' or 'agree.'

	Disagree	Neutral	Agree
11a. Antibiotics are a major risk factor for developing <i>C. diff</i> infection (CDI).	0	\bigcirc	0
11b. C. diff testing requires 3 stool samples.	0	0	0
11c. A test-of-cure should be done after completion of <i>C. diff</i> treatment.	0	0	0
11d. C. diff can be spread by healthcare worker hands.	0	0	0
11e. Test only unformed stool (stool that takes the shape of the container).	0	0	0

Antibiotic Use Attitudes and Beliefs: Nursing Survey Response Facilitator Guide

For each question, summarize the responses for each category among all survey respondents.

1. Please check your current role:
RN
LPN
Other: _____

/ % of RN respondents: ____ / ____

/ % of LPN respondents: ____ / ____

/ % of 'Other' respondents: ____ /____

2. How many years have you been working in a long-term care facility (LTCF)?

/ % of respondents working in LTCF for 0 – 5 years: ____ / ____

/ % of respondents working in LTCF for 6 – 10 years: ____ / ____

/ % of respondents working in LTCF for 11 – 20 years: ____ / ____

/ % of respondents working in LTCF for more than 20 years: ___ / ___

The following are questions about antibiotic use and urinary tract infections.

3. When selecting a response that most accurately reflects your opinion regarding antibiotic use, please choose from the following options: 'antibiotics rarely contribute,' 'antibiotics sometimes contribute,' or 'antibiotics often contribute.' I believe that using antibiotics contributes to:

2. Diarrhan in the narron taking	Rarely	Sometimes	Often			
3a. Diarrhea in the person taking antibiotics	# of responses: % of responses:	# of responses: % of responses:	# of responses: % of responses:			
Suggested facilitator response: Antibiotics can cause side effects for some residents, including diarrhea. Diarrhea may result from the antibiotics killing the helpful gut bacteria, allowing harmful bacteria such as Clostridium difficile, or C. diff, to overgrow. Every exposure to antibiotics puts residents at risk for developing what the Centers for Disease Control and Prevention (CDC) have called 'deadly diarrhea.'						
	Rarely	Sometimes	Often			
3b. Future resistance to antibiotics	# of responses: % of responses:	# of responses: % of responses:	# of responses: % of responses:			
Suggested facilitator response: Antibiotics have been used so widely and for so long that some bacteria have adapted to antibiotics designed to kill them, making the bacteria resistant and the drugs less effective. People infected with antimicrobial-resistant organisms are more likely to have longer, more expensive hospital stays, and may be more likely to die as a result of the infection. Preserving effective antibiotic treatments requires all of us to do our part.						
	Rarely	Sometimes	Often			
3c. Reduced rates of influenza	# of responses: % of responses:	# of responses: % of responses:	# of responses: % of responses:			
Suggested facilitator response: Antibiotics are powerful tools for fighting bacterial illnesses (like strep throat), but they DO NOT work for viral illnesses (like the common cold or influenza). According to the CDC, flu vaccination can reduce flu illness, antibiotic use, doctor visits and lost time from work, as well as prevent hospitalizations and						

deaths. Flu vaccination is important for all healthcare providers as well as residents.

	Rarely	Sometimes	Often
3d. High quality care	# of responses: % of responses:	# of responses: % of responses:	# of responses: % of responses:
Suggested facilitator response: A tho optimal resident care. High quality ca regular reassessments, spending extr interventions.	re can also be demonstrate	d by providing symptoma	tic cares, performing

	# of responses: % of responses:	# of responses: % of responses:	# of responses: % of responses:
Suggested facilitator response: All an antibiotics when they are not needed			
	Rarely	Sometimes	Often
3f. Rash	# of responses: % of responses:	# of responses: % of responses:	# of responses: % of responses:
Suggested facilitator response: While some infections, antibiotics can also c stomach, rash, interaction with other	ause harmful side effects. S	ide effects of antibiotics r	-
2. Femily represention of high	Rarely	Sometimes	Often
3g. Family perception of high quality care	# of responses: % of responses:	# of responses: % of responses:	•
Suggested facilitator response: Use e	vidence-based recommendo s regarding when antibiotic		nd ensure families are

4. When selecting a response that most accurately reflects your opinion about when antibiotics are appropriate for a resident WITH an <u>indwelling catheter</u> and ONLY the following symptoms/findings, please choose from the following options: 'rarely appropriate,' 'sometimes appropriate,' or 'often appropriate.'

Suggested facilitator response: Note that Loeb et al. (2001) Minimum Criteria for Initiation of Antibiotics in LTC Residents differs for residents with or without an indwelling catheter. For LTC residents with an indwelling catheter, at least one of the following should be present in order to initiate antibiotics for urinary tract infection (UTI) (Loeb et al., 2001):

- Fever (>37.9°C [100°F] or a 1.5°C [2.4°F] increase above baseline temperature)
- New costovertebral angle tenderness
- Rigors (shaking chills) with or without identified cause
- New onset of delirium

A. Desident with faul an alling	Rarely	Sometimes	Often
4a. Resident with foul-smelling	# of responses:	# of responses:	# of responses:
urine	% of responses:	% of responses:	% of responses:

Suggested facilitator response: Foul-smelling or cloudy urine has historically been used by nurses and other health care providers as an indicator of a UTI. However, malodorous urine can be caused by several factors, including dehydration, diet, medication, or the presence of specific bacteria. Using urine odor to identify the presence of bacteria in urine resulted in error in 1/3 of cases in one published study. Foul-smelling urine without clinical symptoms of a UTI does not indicate the presence of a UTI, and is not a valid indication for initiating antibiotics, according to Loeb et al. (2001).

	Rarely	Sometimes	Often
4b. Resident with bacteria in urine	# of responses:	# of responses:	# of responses:
	% of responses:	% of responses:	% of responses:

Suggested facilitator response: Urine does not typically contain bacteria, yeast, or white blood cells (pus or pyuria) in younger, healthy people. However, bacteria and pus are frequently found in the urine of elderly and debilitated people due to increased age, chronic disease, functional impairment, invasive devices, dehydration, and other risk factors. Asymptomatic bacteriuria (the presence of bacteria in urine without clinical symptoms of infection) should not be treated with antibiotics, according to evidence-based recommendations (Loeb et al., 2001).

4c. Resident with bacteria and	Rarely	Sometimes	Often
	·	•	# of responses: % of responses:

Suggested facilitator response: Pyuria (the accumulation of white blood cells in the urine) is considered an immune response to the presence of bacteria. However, pyuria is neither sensitive nor specific to the diagnosis of a UTI. If a resident has bacteria in his or her urine, he or she will almost always have pyuria. Pyuria without clinical symptoms should <u>not</u> be treated with antibiotics according to evidence-based recommendations (Loeb et al., 2001).

4d. Change in functional status and	Rarely	Sometimes	Often
family concern about a possible infection	# of responses: % of responses:	•	# of responses: % of responses:

Suggested facilitator response: There are many myths about what symptoms indicate a UTI. While the following symptoms warrant evaluation, they do <u>not</u> warrant antibiotic treatment for UTI, according to Loeb et al. (2001):

- Chronic incontinence (during sleep or when awake, when coughing or sneezing)
- Anorexia
- Difficulty falling asleep or staying asleep
- Fatigue
- Malaise
- Weakness

Use evidence-based recommendations to guide practice, and ensure families are aware of facility policies and protocols regarding when antibiotics are warranted.

As New confusion and history of	Rarely	Sometimes	Often
4e. New confusion and history of urinary tract infection (UTI)	·	# of responses: % of responses:	# of responses: % of responses:

Suggested facilitator response: New confusion and altered mental status may be indicators of a potential UTI, and should be evaluated, but do not meet evidence-based recommendations for antibiotic initiation (Loeb et al., 2001). While it is important to know if the resident has had a UTI as part of his or her medical history, assessments regarding a potential UTI should be based on current symptoms.

	RarelySometimesOften# of responses:# of responses:# of responses:% of responses:% of responses:% of response				
4f. Positive influenza rapid test					
Suggested facilitator response: Influenza is caused by a virus. Antibiotics only treat conditions caused by bacteria. Antivirals are medications that can shorten the severity or duration of symptoms caused by viruses, such as influenza, and may be prescribed for some viral illnesses if diagnosed early. Getting a flu shot at the beginning of each flu season, covering your coughs/sneezes, frequent hand hygiene, and staying home when you are sick are the best ways to avoid getting influenza and prevent the spread of the flu.					
Age Course and groon or vollow	Rarely	Sometimes	Often		
4g. Cough and green or yellow nasal discharge	# of responses: # of responses: # of responses:				

Suggested facilitator response: Viruses cause most coughs and nasal discharge (even the thick, yellow-green stuff!). Viral infections almost always get better on their own – with comfort measures to ease the symptoms. Taking antibiotics does not shorten the duration of the illness.

% of responses:

% of responses:

% of responses:

5. When selecting a response that most accurately reflects your opinion about when antibiotics are appropriate for a resident **WITHOUT** an <u>indwelling catheter</u> and **ONLY** the following symptoms/findings, please choose from the following options: 'rarely appropriate,' 'sometimes appropriate,' or 'often appropriate.'

Suggested facilitator response: Note that Loeb et al. (2001) Minimum Criteria for Initiation of Antibiotics in LTC Residents differs for residents with or without an indwelling catheter. For LTC residents <u>without an indwelling</u> <u>catheter</u>, at least one of the following must be present to meet Loeb et al. (2001) Minimum Criteria for Initiation of Antibiotics for UTI:

- Acute dysuria (painful urination) Note: Dysuria alone is an indication to start antibiotics without any other symptoms
 OR
- Fever: >37.9°C [100°F]; or a 1.5°C [2.4°F] increase above baseline
- **PLUS** at least one of the following symptoms:
 - New or worsening:
 - o Urgency
 - Frequency
 - Suprapubic pain
 - Gross hematuria (blood in urine)
 - Costovertebral angle (CVA) tenderness
 - Urinary incontinence

evaluated in an Emergency	# of responses:	# of responses:	# of responses:
Department (ED) / clinic	% of responses:	% of responses:	% of responses:
			1

Suggested facilitator response: The resident's individual circumstances would need to be taken into account, as a fever may be indicative of more serious illness in the presence of some underlying conditions. The American Medical Directors Association provides guidance on when to transfer a resident with a fever to the ED. For a resident who has a fever without an obvious focus of infection, recommendations for initiating antibiotics include the presence of a fever (>37.9°C [100°F] or a 1.5°C [2.4°F] increase above baseline) and at least one of the following: new onset of delirium or rigors (Loeb et al., 2001).

- 8. **Scenario:** A resident has cloudy, foul-smelling urine; is agitated; slightly more confused than baseline; and has a history of UTI; T = 99.1°F. What would you do? (Circle all that apply)
 - a. Recommend this resident receive antibiotics
 - (# / % of responses: ____ / ___)
 - b. Document resident status and continue to monitor
 - (# / % of responses: ____ / ____)
 - c. Contact the provider for an order to send a urine specimen to the lab for a urinalysis (UA) / urine culture (UC)
 - (# / % of responses: ____ / ____)

Suggested facilitator response: (Incorporate facility protocol into discussion).

An agitated, confused resident with cloudy, foul-smelling urine and a history of UTI does not meet recommendations for initiating antibiotics in LTC residents (Loeb et al. 2001). The 99.1°F temperature would not meet the recommendations unless the resident's baseline temperature was 96.7°F or lower (meeting the 2.4°F increase above baseline temperature criterion). A provider notification to evaluate the resident's change in status would be appropriate; however, in the absence of needing to determine an effective antimicrobial selection, a urine culture (UC) may be of little benefit. A urinalysis (UA) could be considered if evaluating for other conditions that may be contributing to the resident's condition. Documenting resident status and continuing to monitor while implementing nursing interventions would generally be appropriate. Interventions should reflect guidance outlined in facility policy/ protocol.

9. I believe antibiotics are effective against infections caused by viruses such as influenza ("flu").

True (# / % of responses: ____ / ____) False (# / % of responses: ____ / ____)

Suggested facilitator response: Antibiotics will not prevent, treat, or shorten the course of a viral illness; antibiotics only treat infections caused by bacteria. Viral infections almost always get better on their own – with comfort measures to ease the symptoms. Taking antibiotics while the viral infection runs its course does not shorten the duration of the illness.

10. I believe that other than an allergy to an antibiotic, there are no side effects to taking antibiotics.

True (# / % of responses: ____ / ___) False (# / % of responses: ____ / ___)

Suggested facilitator response: Inappropriate antibiotic use contributes to antibiotic resistance. Infections caused by antibiotic-resistant bacteria can be more severe, require more powerful and toxic antibiotics, and can lead to secondary infections, longer hospital stays, and increased healthcare costs. Additionally, antibiotics can cause adverse reactions and side effects; some of these can be severe. Adverse effects caused by antibiotics can include:

- Allergic reactions
- Adverse drug interactions
- Increased rates of re-infection with resistant organisms
- Yeast infections (antibiotics alter normal flora, allowing Candida albicans, a common yeast, to over-grow and cause an infection)
- Diarrhea
- Disruption of normal bowel flora (antibiotics kill normal bowel flora, leaving space for disease-causing bacteria such as Clostridium difficile to multiply.

11. When selecting a response that most accurately reflects your beliefs about *Clostridium difficile (C. diff)* infection, please choose from the following options: 'disagree,' 'neutral,' or 'agree.'

11a. Antibiotics are a major risk	Disagree	Neutral	Agree
factor for developing C.	# of responses:	# of responses:	# of responses:
diff infection (CDI).	% of responses:	% of responses:	% of responses:
Suggested facilitator response: The c	olon is home to hundred	ds of types of bacteria that	t perform important
ligestive functions. Bacteria that or	dinarily live in the digest	tive tract are called the no	rmal bowel flora. Normal
owel flora may include C. diff bacter	ria. When a person take	s antibiotics the normal b	owel flora is disrupted,
llowing C. diff bacteria to overgrow.

Antibiotic Use Attitudes and Beliefs Survey Cover Letter Template for Providers

«<mark>Date</mark>»

Dr. «First_Name» «Last_Name» «Address» «City», «State» «ZIP»

Dear Dr. «Last_Name»:

«Facility Name» is conducting an anonymous survey about infections and antibiotic use in long-term care facilities; your participation is kindly requested.

While I strongly support this effort, I am very aware of the constraints on your time. Only the most pertinent survey questions are included; the survey will take less than 15 minutes to complete. Please answer the questions as honestly and completely as possible. Please return your completed survey to «location» by «date 2 weeks from distribution». Thank you in advance for your participation!

If you have any questions about the survey please don't hesitate to contact «<mark>Name</mark>» at «<mark>phone number</mark> and/or email address</mark>».

Sincerely,

«<mark>Name</mark>», «<mark>Credentials</mark>» Medical Director «<mark>Facility</mark>»

Enclosure: Antimicrobial Use Attitudes and Beliefs: Provider Survey

Antibiotic Use Attitudes and Beliefs: Provider Survey

1. Please check your current role: \Box MD / DO \Box NP \Box PA \Box Other: _____

2. How many years have you been providing direct care in a long-term care facility? □ 0-5 □ 6-10 □ 11-20 □ More than 20

The following are questions about antibiotic use and urinary tract infections.

3. When selecting a response that most accurately reflects your opinion regarding antibiotic use, please choose from the following options: 'antibiotics rarely contribute,' 'antibiotics sometimes contribute,' or 'antibiotics often contribute.'

I believe that using antibiotics contributes to:

	Rarely	Sometimes	Often
3a. Diarrhea in the person taking antibiotics	\bigcirc	0	\bigcirc
3b. Future resistance to antibiotics	0	0	\bigcirc
3c. Reduced rates of influenza	0	0	0
3d. High quality care	0	0	0
3e. Interaction with other medications	0	0	0
3f. Rash	0	0	0
3g. Family perception of high quality care	0	0	0

4. When selecting a response that most accurately reflects your opinion about when antibiotics are appropriate for a resident WITH an <u>indwelling catheter</u> and ONLY the following symptoms/findings, please choose from the following options: 'rarely appropriate,' 'sometimes appropriate,' or 'often appropriate.'

	Rarely	Sometimes	Often
4a. Resident with foul-smelling urine	\bigcirc	\bigcirc	0
4b. Resident with bacteria in urine	\bigcirc	0	0
4c. Resident with bacteria and white blood cells (WBC) in urine	0	0	0
4d. Change in functional status and family concern about a possible infection	0	0	\bigcirc
4e. New confusion and history of urinary tract infection (UTI)	0	\bigcirc	\bigcirc
4f. Positive influenza rapid test	0	0	0
4g. Cough and green or yellow nasal discharge	0	0	0

5. When selecting a response that most accurately reflects your opinion about when antibiotics are appropriate for a resident **WITHOUT** an <u>indwelling catheter</u> and **ONLY** the following symptoms/findings, please choose from the following options: 'rarely appropriate,' 'sometimes appropriate,' or 'often appropriate.'

	Rarely	Sometimes	Often
5a. Resident with foul smelling urine	\bigcirc	\bigcirc	\bigcirc
5b. Resident with bacteria in urine	0	0	0
5c. Resident with bacteria and white blood cells (WBCs) in urine	0	0	0
5d. Change in functional status and family concern about a possible infection	0	0	\bigcirc
5e. New confusion and history of urinary tract infection (UTI)	\bigcirc	\bigcirc	\bigcirc
5f. Positive influenza rapid test	0	0	0
5g. Cough and green or yellow nasal discharge	0	0	0

6. When selecting a response that most accurately reflects your opinion about when action should be taken, please choose from the following options: 'rarely take the following action,' 'sometimes take the following action,' or 'often take the following action.'

When assessing an otherwise stable and alert resident with a fever, no other complaints, and a history of urinary tract infections (UTIs), would you:

	Rarely	Sometimes	Often
6a. Increase frequency of monitoring vital signs	\bigcirc	\bigcirc	\bigcirc
6b. Order urinalysis and culture (UA/UC)	0	0	0
6c. Initiate empiric antibiotic	0	0	0
6d. Review resident history and symptoms	0	0	0
6e. Review resident's current medications	0	0	0
6f. Encourage fluids (if no fluid restrictions)	0	0	0
6g. Refer resident to Emergency Department (ED) /clinic for evaluation	0	0	0

7. When selecting a response that most accurately reflects your beliefs about ways to prevent the spread of diseases, please choose from the following options: 'disagree,' 'neutral,' or 'agree.'

	Disagree	Neutral	Agree
7a. I only need to remove gloves when they look dirty.	\bigcirc	\bigcirc	\bigcirc
7b. Flu can be spread to others before the infected person has symptoms of influenza	0	0	0
7c. You can get the flu from the flu shot.	0	0	0

- 8. **Scenario:** A resident has cloudy, foul-smelling urine; is agitated; slightly more confused than baseline; and has a history of UTI. T = 99.1°F. What would you do? (Circle all that apply)
 - a. Initiate empiric antibiotic
 - b. Order a urinalysis (UA) / urine culture (UC)
 - c. Encourage fluids (if not contraindicated) and continue to monitor
- 9. I believe antibiotics are effective against infections caused by viruses such as influenza ("flu"). _____ True or _____ False
- 10. I believe that other than an allergy to an antibiotic, there are no side effects to taking antibiotics. _____ True or _____ False
- 11. When selecting a response that most accurately reflects your beliefs about *Clostridium difficile* (*C. diff*) infection, please choose from the following options: 'disagree,' 'neutral,' or 'agree.'

	Disagree	Neutral	Agree
11a. Antibiotics are a major risk factor for developing <i>C. diff</i> infection (CDI).	0	0	0
11b. <i>C. diff</i> testing requires 3 stool samples.	0	0	0
11c. A test-of-cure should be done after completion of <i>C. diff</i> treatment.	0	0	0
11d. Test only unformed stool (stool that takes the shape of the container).	0	0	0

12. When selecting a response that most accurately reflects your beliefs regarding the usefulness of the antimicrobial stewardship strategies below, please choose from the following options: 'rarely useful,' 'sometimes useful,' or 'often useful.'

	Rarely	Sometimes	Often
12a. Available order sets to guide antibiotic prescribing	\bigcirc	0	\bigcirc
12b. Facility process for reviewing empirically prescribed antibiotics based on culture results	0	0	\bigcirc
12c. Lab summary report of antibiotic resistance among facility residents (e.g., antibiogram)	0	0	\bigcirc
12d. Feedback from a pharmacist on antibiotic prescribing practices to medical personnel	0	0	\bigcirc
12e. Nursing education to enhance capacity to accurately assess and report resident condition	0	0	\bigcirc
12f. Education to residents and family about antibiotic use	0	0	0

Antibiotic Use Attitudes and Beliefs: Provider Survey Response Facilitator Guide

For each question, summarize the responses for each category among all survey respondents.

1. Please check your current role:

- # / % of MD / DO respondents: ____ / ____
- # / % of NP respondents: ____ / ____
- # / % of PA respondents: ____ / ____
- # / % of 'Other' respondents: ____ / ____
- 2. How many years have you been providing direct care in a long-term care facility (LTCF)?
 - # / % of respondents providing direct care in LTCF for 0 5 years: ____ / ____
 - # / % of respondents providing direct care in LTCF for 6 10 years: ____ / ____
 - # / % of respondents providing direct care in LTCF for 11 20 years: ____ / ____
 - # / % of respondents providing direct care in LTCF for more than 20 years: ____ / ____

The following are questions about antibiotic use and urinary tract infections.

3. When selecting a response that most accurately reflects your opinion regarding antibiotic use, please choose from the following options: 'antibiotics rarely contribute,' 'antibiotics sometimes contribute,' or 'antibiotics often contribute.' I believe that using antibiotics contributes to:

3a. Diarrhea in the person	Rarely	Sometimes	Often				
taking antibiotics	# of responses:	# of responses:	# of responses:				
	% of responses:	% of responses:	% of responses:				
Suggested facilitator response: Anti							
	Clostridium difficile to multiply, leading to diarrhea. Every exposure to antibiotics puts residents at risk for developing what the Centers for Disease Control and Prevention (CDC) have dubbed 'deadly diarrhea'.						
3b. Future resistance to	Rarely	Sometimes	Often				
antibiotics	# of responses:	# of responses:	# of responses:				
antibiotics	% of responses:	% of responses:	% of responses:				
may be more likely to die as a result do our part.	t of the infection. Preservin Rarely	g effective antibiotic treatr Sometimes	nents requires all of us to Often				
3c.Reduced rates of influenza		# of responses:	# of responses:				
		% of responses:	% of responses:				
Suggested facilitator response: Flu	vaccination is important fo	r all healthcare providers a	s well as residents.				
According to the CDC, flu vaccination			-				
well as prevent hospitalizations and			care provider's				
recommendation plays a critical role in a patient's decision to get a seasonal flu vaccine.							
	Rarely	Sometimes	Often				
3d. High quality care	# of responses:	# of responses:	# of responses:				
	% of responses:	% of responses:	% of responses:				

Suggested facilitator response: A thorough resident assessment may reveal that antibiotics are indicated for optimal resident care. High quality care can also be demonstrated by 1) preventing infections through the use of vaccinations, preventing conditions that lead to infections, and removing unnecessary devices; 2) <u>effectively</u> <u>diagnosing and treating infections</u> through the use of established criteria and microbiology data; 3) <u>optimizing use</u> <u>of antibiotics</u> by prescribing only when clinical criteria for antibiotics are met, not prescribing antibiotics for colonization, and by following published guidelines for the appropriate dose and duration of antibiotics; and 4) <u>preventing transmission</u> by isolating the pathogen, breaking the chain of infection, performing hand hygiene, and identifying residents with multi-drug resistant organisms (MDRO).

	Rarely	Sometimes	Often		
3e. Interaction with other medications	# of responses: % of responses:	# of responses: % of responses:	# of responses: % of responses:		
Suggested facilitator response: All antibiotics have the potential to interact with other medications. Prescribing antibiotics when they are not needed can increase residents' chances of experiencing an adverse drug reaction.					
	Rarely	Sometimes	Often		
3f. Rash	# of responses:	# of responses:	# of responses:		
	% of responses:	% of responses:	% of responses:		
Suggested facilitator response: While antibiotics are powerful medicines and are essential to the treatment of some infections, antibiotics can also cause harmful side effects. Side effects of antibiotics may include: upset stomach, rashes, interactions with other medications, and diarrhea.					
	Rarely	Sometimes	Often		
3g. Family perception of high quality care	# of responses: % of responses:	# of responses: % of responses:	# of responses : % of responses:		
Suggested facilitator response: Use evidence-based recommendations to guide practice, and ensure families are aware of facility policies and protocols regarding when antibiotics are warranted.					

4. When selecting a response that most accurately reflects your opinion about when antibiotics are appropriate for a resident **WITH** an <u>indwelling catheter</u> and **ONLY** the following symptoms/findings, please choose from the following options: 'rarely appropriate,' 'sometimes appropriate,' or 'often appropriate.'

Suggested facilitator response: Note that Loeb et al. (2001) Minimum Criteria for Initiation of Antibiotics in LTC Residents differs for residents with or without an indwelling catheter. For LTC residents with an indwelling catheter, at least one of the following should be present in order to initiate antibiotics for UTI (Loeb et al., 2001):

- Fever (>37.9°C [100°F] or a 1.5°C [2.4°F] increase above baseline temperature)
- New costovertebral angle tenderness
- Rigors (shaking chills) with or without identified cause
- New onset of delirium

4a. Resident with foul-smelling	Rarely	Sometimes	Often	
urine	# of responses:	# of responses:	# of responses:	
	% of responses:	% of responses:	% of responses:	
Suggested facilitator response: Foul-smelling or cloudy urine has historically been used by health care providers as an indicator of a urinary tract infection (UTI). However, malodorous urine can be caused by several factors, including dehydration, diet, medication, or the presence of specific bacteria. Using urine odor to identify the presence of bacteria in urine resulted in error in 1/3 of cases in one published study. Foul-smelling urine without clinical symptoms of a UTI is not a valid indication for initiating antibiotics, according to Loeb et al. (2001).				
Ab Desident with basteria in	Rarely	Sometimes	Often	
4b. Resident with bacteria in urine	# of responses:	# of responses:	# of responses:	
unne	% of responses:	% of responses:	% of responses:	
Suggested facilitator response: Urine does not typically contain bacteria, yeast, or white blood cells (pus or pyuria) in younger, healthy people. However, bacteria and pus are frequently found in the urine of elderly and				

and other risk factors. Asymptomatic bacteriuria (the presence of bacteria in urine without clinical symptoms of infection) should not be treated with antibiotics, according to evidence-based recommendations (Loeb et al., 2001). Rarely Sometimes Often 4c. Resident with bacteria and white blood cells (WBC) in # of responses: # of responses: # of responses: urine % of responses: % of responses: % of responses: Suggested facilitator response: Pyuria (the accumulation of white blood cells in the urine) is considered an immune response to the presence of bacteria. However, pyuria is neither sensitive nor specific to the diagnosis of a UTI. If a resident has bacteria in his or her urine, he or she will almost always have pyuria. Pyuria without clinical symptoms should not be treated with antibiotics according to evidence-based recommendations (Loeb et al., 2001). Often Rarely Sometimes 4d. Change in functional status and family concern about # of responses: # of responses: # of responses: a possible infection % of responses: % of responses: % of responses: Suggested facilitator response: There are many myths about what symptoms indicate a UTI. While the following symptoms warrant evaluation, they do not warrant antibiotic treatment for UTI, according to Loeb et al. (2001): *Chronic incontinence (during sleep or when awake, when coughing or sneezing)* Anorexia Difficulty falling asleep or staying asleep Fatigue Malaise Weakness Use evidence-based recommendations to guide practice, and ensure families are aware of facility policies and protocols regarding when antibiotics are warranted. Sometimes Often Rarely 4e. New confusion and history of urinary tract infection # of responses: # of responses: # of responses: (UTI) % of responses: % of responses: % of responses: Suggested facilitator response: New confusion and altered mental status may be indicators of a potential UTI, and should be evaluated, but do not meet evidence-based recommendations for antibiotic initiation (Loeb et al., 2001). While it is important to know if the resident has a UTI as part of his or her medical history, deciding if antibiotics are needed to treat a potential UTI should be based on current symptoms. Often Rarely Sometimes 4f. Positive influenza rapid test # of responses: _____ # of responses: # of responses: % of responses: _____ % of responses: % of responses: Suggested facilitator response: Influenza is caused by a virus. Antibiotics only treat conditions caused by bacteria. Antivirals are medications that can shorten the severity or duration of symptoms caused by viruses, such as influenza, and may be prescribed for some viral illnesses if diagnosed early. Getting a flu shot at the beginning of each flu season, covering your coughs/sneezes, and frequent hand hygiene, and staying home when you are sick are the best ways to avoid getting influenza and prevent the spread of the flu. Often Rarely Sometimes 4g. Cough and green or yellow # of responses: _____ # of responses: # of responses: nasal discharge ____ % of responses: _ % of responses: % of responses: Suggested facilitator response: Viruses cause most coughs and nasal discharge (even the thick, yellow-green stuff!). Viral infections almost always get better on their own – with comfort measures to ease the symptoms. Taking antibiotics does not shorten the duration of the illness.

debilitated people due to increased age, chronic disease, functional impairment, invasive devices, dehydration,

5. When selecting a response that most accurately reflects your opinion about when antibiotics are appropriate for a resident **WITHOUT** an <u>indwelling catheter</u> and **ONLY** the following symptoms/findings, please choose from the following options: 'rarely appropriate,' 'sometimes appropriate,' or 'often appropriate.'

Suggested facilitator response: Note that Loeb et al. (2001) Minimum Criteria for Initiation of Antibiotics in LTC Residents differs for residents with or without an indwelling catheter. For LTC residents <u>without an indwelling</u> <u>catheter</u>, at least one of the following must be present to meet Loeb et al. (2001) Minimum Criteria for Initiation of Antibiotics for UTI:

- Acute dysuria (painful urination) Note: Dysuria alone is an indication to start antibiotics without any other symptoms
- Fever: >37.9°C [100°F]; or a 1.5°C [2.4°F] increase above baseline PLUS at least one of the following symptoms:
 - *New or worsening:*
 - o Urgency
 - o Frequency
 - Suprapubic pain
 - Gross hematuria (blood in urine)
 - Costovertebral angle (CVA) tenderness
 - o Urinary incontinence

	Rarely	Sometimes	Often
5a. Resident with foul-smelling	# of responses:	# of responses:	# of responses:
urine	% of responses:	% of responses:	% of responses:

Suggested facilitator response: Foul-smelling or cloudy urine has historically been used by health care providers as an indicator of a urinary tract infection (UTI). However, malodorous urine can be caused by several factors, including dehydration, diet, medication, or the presence of specific bacteria. Using urine odor to identify the presence of bacteria in urine resulted in error in 1/3 of cases in one published study. Foul-smelling urine without clinical symptoms of a UTI does not indicate the presence of a UTI, and is not a valid indication for initiating antibiotics.

	Rarely	Sometimes	Often
5b. Resident with bacteria in	# of responses:	# of responses:	# of responses:
urine	% of responses:	% of responses:	% of responses:

Suggested facilitator response: Urine does not typically contain bacteria, yeast, or white blood cells (pus or pyuria) in younger, healthy people. However, bacteria and pus are frequently found in the urine of elderly and debilitated people due to increased age, chronic disease, functional impairment, invasive devices, and dehydration, and other risk factors. Asymptomatic bacteriuria (the presence of bacteria in urine without clinical symptoms of infection) should not be treated with antibiotics, according to evidence-based recommendations (Loeb et al., 2001).

5c. Resident with bacteria and	Rarely	Sometimes	Often
white blood cells (WBCs)	# of responses:	# of responses:	# of responses:
in urine	% of responses:	% of responses:	% of responses:

Suggested facilitator response: Pyuria (the accumulation of white blood cells in the urine) is considered an immune response to the presence of bacteria. However, pyuria is neither sensitive nor specific to the diagnosis of a UTI. If a resident has bacteria in his or her urine, he or she will almost always have pyuria. Pyuria without clinical symptoms should <u>not</u> be treated with antibiotics (Loeb et al., 2001).

5d. Change in functional status	Rarely	Sometimes	Often
and family concern about	# of responses:	# of responses:	# of responses:

5e. New confusion and history	Rarely	Sometimes	Often	
of urinary tract infection	# of responses:	# of responses:	# of responses:	
(UTI)	% of responses:	% of responses:	% of responses:	
Suggested facilitator response: New confusion and altered mental status may be indicators of a potential UTI, and should be evaluated, but do not meet Loeb et al. (2001) Minimum Criteria for Initiation of Antibiotics in Long-term Care (LTC) Residents. Knowledge of a resident's UTI history may be helpful when making care decisions, such as teaching regarding perineal hygiene, wiping front-to-back, promoting/prompting regular urination, and adequate fluid intake, if not contraindicated. However, a resident's current clinical signs and symptoms should be considered when assessing for a UTI.				
	Rarely	Sometimes	Often	
5f. Positive influenza rapid test	# of responses:	# of responses:	# of responses:	
	% of responses:	% of responses:	% of responses:	
Suggested facilitator response: Influenza is caused by a virus. Antibiotics only treat conditions caused by bacteria. Antivirals are medications that can shorten the severity or duration of symptoms caused by some viruses, such as influenza. These medications may be prescribed in some situations and if the viral illness is diagnosed early. Getting a flu shot at the beginning of each flu season, covering your coughs/sneezes, frequent hand hygiene, and staying home when you are sick are the best ways to prevent influenza.				
	Rarely	Sometimes	Often

7. When selecting a response that most accurately reflects your beliefs about ways to prevent the spread of diseases, please choose from the following options: 'disagree,' 'neutral,' or 'agree.'

7a. I only need to remove	Disagree	Neutral	Agree
gloves when they look	# of responses:	# of responses:	# of responses:
dirty.	% of responses:	% of responses:	% of responses:

Suggested facilitator response: Organisms can live on people and objects in the environment, including hard surfaces like tables, faucets, and pens, as well as soft surfaces like papers, clothing, blankets, etc. Touching any of these objects- with gloves or bare hands- and then touching another surface, including a resident (or yourself) can transmit pathogenic organisms. Remove your gloves and clean your hands after resident examinations/ procedures where hands have come into contact with bodily fluids/ mucous membranes or the resident's environment, and prior to subsequent examinations/ procedures for the same resident and in between different residents.

7b. Flu can be spread to others	Disagree	Neutral	Agree	
before the infected person has symptoms of influenza.	# of responses: % of responses:	# of responses: % of responses:	# of responses: % of responses:	
Suggested facilitator response: Infected people, including healthcare workers, can spread influenza before flu symptoms even develop. According to CDC, adults shed influenza virus from the day before symptoms begin through 5—10 days after illness onset, although shedding may last longer in persons with underlying health conditions. Getting a flu shot protects vulnerable residents, improves patient safety, and can significantly decrease morbidity and mortality.				
decrease morbidity and mortality.				
	Disagree	Neutral	Agree	
7c. You can get the flu from	Disagree # of responses:	Neutral # of responses:	Agree # of responses:	
			U	

infected with one of these viruses and become ill at the same time they receive the flu shot.

8. **Scenario:** A resident has cloudy, foul-smelling urine; is agitated; slightly more confused than baseline; and has a history of UTI. $T = 99.1^{\circ}F$. What would you do?

- a. Initiate empiric antibiotic
 - (# / % of responses: ____ / ____)
- b. Order a urinalysis (UA) / urine culture (UC)
 - (# / % of responses: ____ / ___)
- c. Encourage fluids (if not contraindicated) and continue to monitor (# / % of responses: ____ / ___)

Suggested facilitator response: (incorporate facility protocol into discussion) An agitated, confused resident with cloudy, foul-smelling urine and a history of UTI does not meet recommendations for initiating antibiotics in LTC residents (Loeb et al. 2001). The 99.1°F temperature would not meet the recommendations unless the resident's baseline temperature was 96.7°F or lower (meeting the 2.4°F increase above baseline temperature criterion). Even in the presence of an elevated temperature, if localizing urinary tract signs and symptoms (e.g. urgency, frequency, suprapubic pain, hematuria, CVA tenderness, and incontinence) are absent, this resident would not meet the evidence-based recommendations. Evaluating the resident's change in status would be appropriate; however, in the absence of needing to determine an effective antimicrobial selection, UC may be of little benefit. A UA could be considered if evaluating for other conditions that may be contributing to the resident's condition. Documenting resident status and continuing to monitor while promoting hydration (in the absence of contraindications) would generally be appropriate in addressing the cloudy, foul-smelling urine.

 9. I believe antibiotics are effective against infections caused by viruses such as influenza ("flu"). True (# / % of responses: ___ / ___)
 False (# / % of responses: ___ / ___)

Suggested facilitator response: Antibiotics will not prevent, treat, or shorten the course of a viral illness; antibiotics only treat conditions caused by bacteria. Viral infections frequently get better on their own – with comfort measures to ease the symptoms. Taking antibiotics while the viral infection runs its course does not shorten the duration of the illness.

10. I believe that other than an allergy to an antibiotic, there are no side effects to taking antibiotics.

True (# / % of responses: ___ / ___) False (# / % of responses: ___ / ___)

Suggested facilitator response: Inappropriate antibiotic use contributes to antibiotic resistance. Infections caused by antibiotic-resistant organisms can be more severe, require more powerful and toxic antibiotics, and can lead to secondary infections, longer hospital stays, and increased healthcare costs. Additionally, antibiotics can cause adverse reactions and side effects; some of these can be severe. Adverse effects caused by antibiotics can include:

- Allergic reactions
- Adverse drug interactions

- Increased rates of re-infection with resistant organisms
- Yeast infections (antibiotics alter normal flora, allowing Candida albicans, a common yeast, to over-grow and cause an infection)
- Diarrhea
- Disruption of normal bowel flora (antibiotics kill normal bowel flora, leaving space for disease-causing bacteria such as Clostridium difficile to multiply).

11. When selecting a response that most accurately reflects your beliefs about *Clostridium difficile (C. diff*) infection, please choose from the following options: 'disagree,' 'neutral,' or 'agree.'

11a. Antibiotics are a major risk	Disagree	Neutral	Agree

Suggested facilitator response: Strategies to optimize antimicrobial prescribing are important for antimicrobial stewardship. The Infectious Diseases Society of America (IDSA) and the Society for Healthcare Epidemiology of America (SHEA) developed guidelines for hospital-based antimicrobial stewardship programs (Dellit et al., 2007). The IDSA/SHEA guidelines acknowledge the limited data available to support antimicrobial stewardship interventions in the long-term care setting, but offer the core and supplementary strategies for acute care hospitals listed below. Providers' beliefs, when considered in conjunction with published recommendations, may help prioritize the implementation of antimicrobial stewardship strategies.

Core strategies

- Prospective audit of antimicrobial use with intervention by an infectious diseases physician or a clinical pharmacist and feedback to the prescriber
- Formulary restriction and preauthorization requirements

Supplementary strategies

- Education that incorporates active intervention
- Evidence-based practice guideline development
- Antimicrobial order forms to facilitate the implementation of practice guidelines
- Streamlining or de-escalation of therapy
- Dose optimization
- Parenteral to oral conversion
