Summary of the 2014-15 Season

- 4,153 people were hospitalized with laboratory-confirmed influenza
- 10 pediatric influenza-related deaths were confirmed
- 192 outbreaks of influenza in long-term care were reported
- 706 outbreaks of ILI in schools were reported

Neighboring states’ influenza information:
- Iowa http://www.idph.state.ia.us/IdphArchive/Archive.aspx?channel=FluReports
- South Dakota http://doh.sd.gov/diseases/infectious/flu/
Hospitalized influenza cases are based on disease reports of laboratory-positive influenza (via DFA, IFA, viral culture, EIA, rapid test, paired serological tests or RT-PCR) and specimens from hospitalized patients with acute respiratory illness submitted to MDH-PHL by hospitals and laboratories.

### Median age (years) at time of admission

76.0
School Outbreaks

K-12 schools report an outbreak of influenza-like illness (ILI) when the number of students absent with ILI reaches 5% of total enrollment or three or more students with ILI are absent from the same elementary classroom.

Influenza-like Illness (ILI) in Schools by Season

The diagram shows the number of influenza-like illness outbreaks by MMWR Week for the years 2010-11 to 2014-15. The total number of outbreaks is 705.
Long-Term Care (LTC) Outbreaks
LTC facilities report to MDH when they suspect an outbreak of influenza in their facility. Laboratory confirmed outbreaks are reported here.
MDH collaborates with healthcare providers who report the total number of patients seen and the total number of those patients presenting to outpatient clinics with influenza-like illness.

**Sentinel Provider Surveillance (Outpatients)**

Percentage of Persons Presenting to Outpatient Clinics with Influenza-Like Illness (ILI)

- **2013-14**
- **2014-15**

**Peak % of outpatients with ILI**

7.85%
The MN Lab System (MLS) Laboratory Influenza Surveillance Program is made up of more than 310 clinic- and hospital-based laboratories, voluntarily submitting testing data weekly. These laboratories perform rapid testing for influenza and Respiratory Syncytial Virus (RSV). Significantly fewer labs perform PCR testing for influenza and three also perform PCR testing for other respiratory viruses. MDH-PHL provides further characterization of submitted influenza isolates to determine the hemagglutinin serotype to indicate vaccine coverage. Tracking the laboratory results assists healthcare providers with patient diagnosis of influenza-like illness and provides an indicator of the progression of the influenza season as well as prevalence of disease in the community.

### Specimens Positive for Influenza by RT-PCR, by Week

**Peak % RT-PCR positive**
