

Weekly Influenza & Respiratory Illness Activity Report

A summary of influenza surveillance indicators prepared by the Division of Infectious Disease Epidemiology Prevention & Control

Week Ending December 14, 2019 | WEEK 50

All data are preliminary and may change as more information is received

Minnesota Influenza Geographic Spread

No Activity

Sporadic

Local

Regional

Widespread

During the week ending December 14, 2019 (Week 50), surveillance indicators showed widespread geographic spread of influenza *(based on CDC's Activity Estimates Definitions)*.

Since the start of the influenza season, no pediatric influenza-related deaths have been reported.

Hospitalized Influenza Surveillance

Hospitalized influenza cases are based on disease reports of laboratory-positive influenza (via DFA, IFA, viral culture, EIA, rapid test, paired serological tests or RT-PCR) and specimens from hospitalized patients with acute respiratory illness submitted to MDH-PHL by hospitals and laboratories. **Due to the need to confirm reports and reporting delays, consider current week data preliminary.**

Hospitalized Influenza Cases by Type Minnesota (FluSurv-NET*)

Hospitalized Influenza Cases by Season, Minnesota (FluSurv-NET*)

Hospitalizations this week	Hospitalizations last week	Total hospitalizations (to date)
61	48	262

Season	Total hospitalizations (historic)
2014-2015	4,081
2015-2016	1,538
2016-2017	3,695
2017-2018	6,446
2018-2019	2,543
2019-2020	262 (to date)

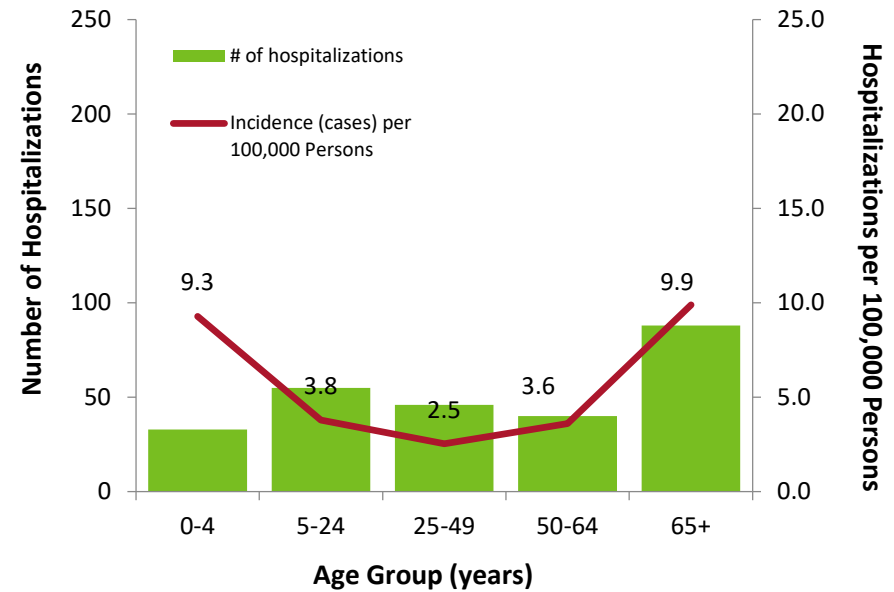

*Influenza Surveillance Network

Hospitalized Influenza Surveillance (continued)

Number of Influenza Hospitalizations and Incidence by Region, Minnesota September 29, 2019 – December 14, 2019

Number of Influenza Hospitalizations and Incidence by Age, Minnesota September 29, 2019 – December 14, 2019

Region	Hospitalizations this week	Total (to date)
Central	6 (10%)	34 (13%)
Metro	45 (74%)	192 (73%)
Northeast	1 (2%)	4 (2%)
Northwest	3 (5%)	8 (3%)
South Central	1 (2%)	5 (2%)
Southeast	1 (2%)	10 (4%)
Southwest	1 (2%)	4 (2%)
West Central	3 (5%)	5 (2%)

Median age (years) at time of admission
47.0

Influenza-Associated Death Surveillance

Influenza deaths are collected via reports from Minnesota's death certificate database, hospitals, and long-term care facilities. Decedents with influenza listed as a cause of or contributor to death, have recent laboratory confirmation of influenza, or are part of an ongoing influenza outbreak at a long-term care facility are reported to influenza surveillance. **Due to the need to confirm reports and reporting delays, consider current week data preliminary.**

Deaths Associated with Influenza by Season, Minnesota

Deaths Associated with Influenza by Age Group and Season, Minnesota

Season	Total deaths (historic)	Total pediatric (<18 years) deaths (historic)
2014-2015	368	10
2015-2016	76	3
2016-2017	273	2
2017-2018	440	6
2018-2019	95	1
2019-2020	6 (to date)	0 (to date)

Season	Median age (years) at time of death
2014-2015	85
2015-2016	68
2016-2017	86
2017-2018	85
2018-2019	75
2019-2020	75 (to date)

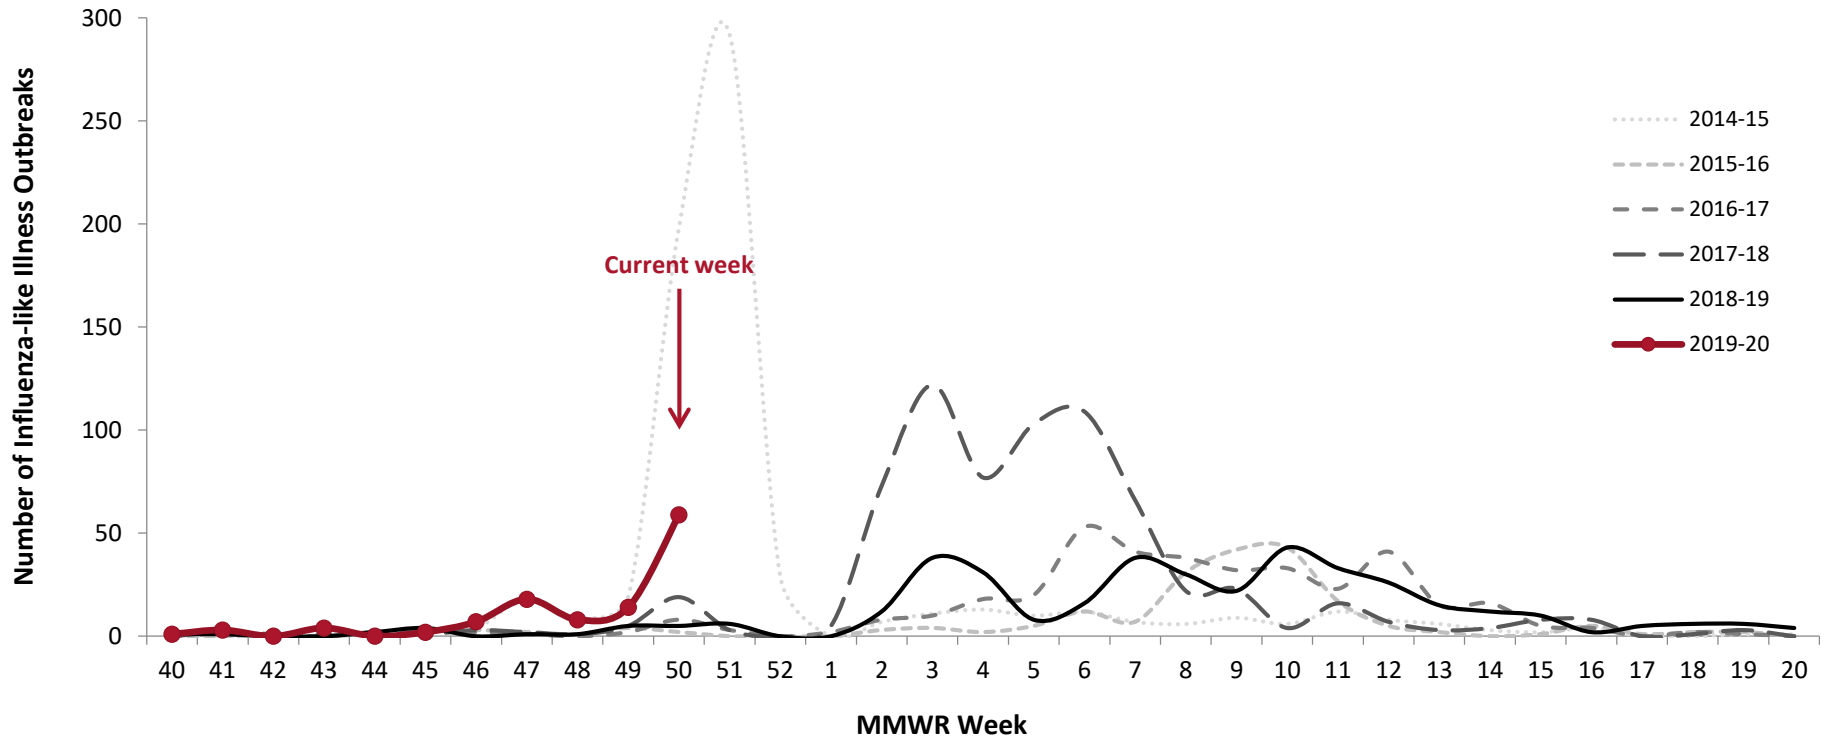

*Influenza Surveillance Network

Respiratory Disease Outbreak Surveillance

School Outbreaks

K-12 schools report an outbreak of influenza-like illness (ILI) when the number of students absent with ILI reaches 5% of total enrollment or three or more students with ILI are absent from the same elementary classroom.

Influenza-like Illness (ILI) in Schools by Season

New school outbreaks this week	New school outbreaks last week	Total this season (to date)
60	14	123

Long-Term Care (LTC) Outbreaks

LTC facilities report to MDH when they suspect an outbreak of influenza in their facility. Laboratory-confirmed outbreaks are reported here.

Confirmed Influenza Outbreaks in LTC by Season

New LTC outbreaks this week	New LTC outbreaks last week	Total this season (to date)
0	3	7

Sentinel Provider Surveillance (Outpatients)

MDH collaborates with healthcare providers who report the total number of patients seen and the total number of those patients presenting to outpatient clinics with influenza-like illness.

Percentage of Persons Presenting to Outpatient Clinics with Influenza-Like Illness (ILI)

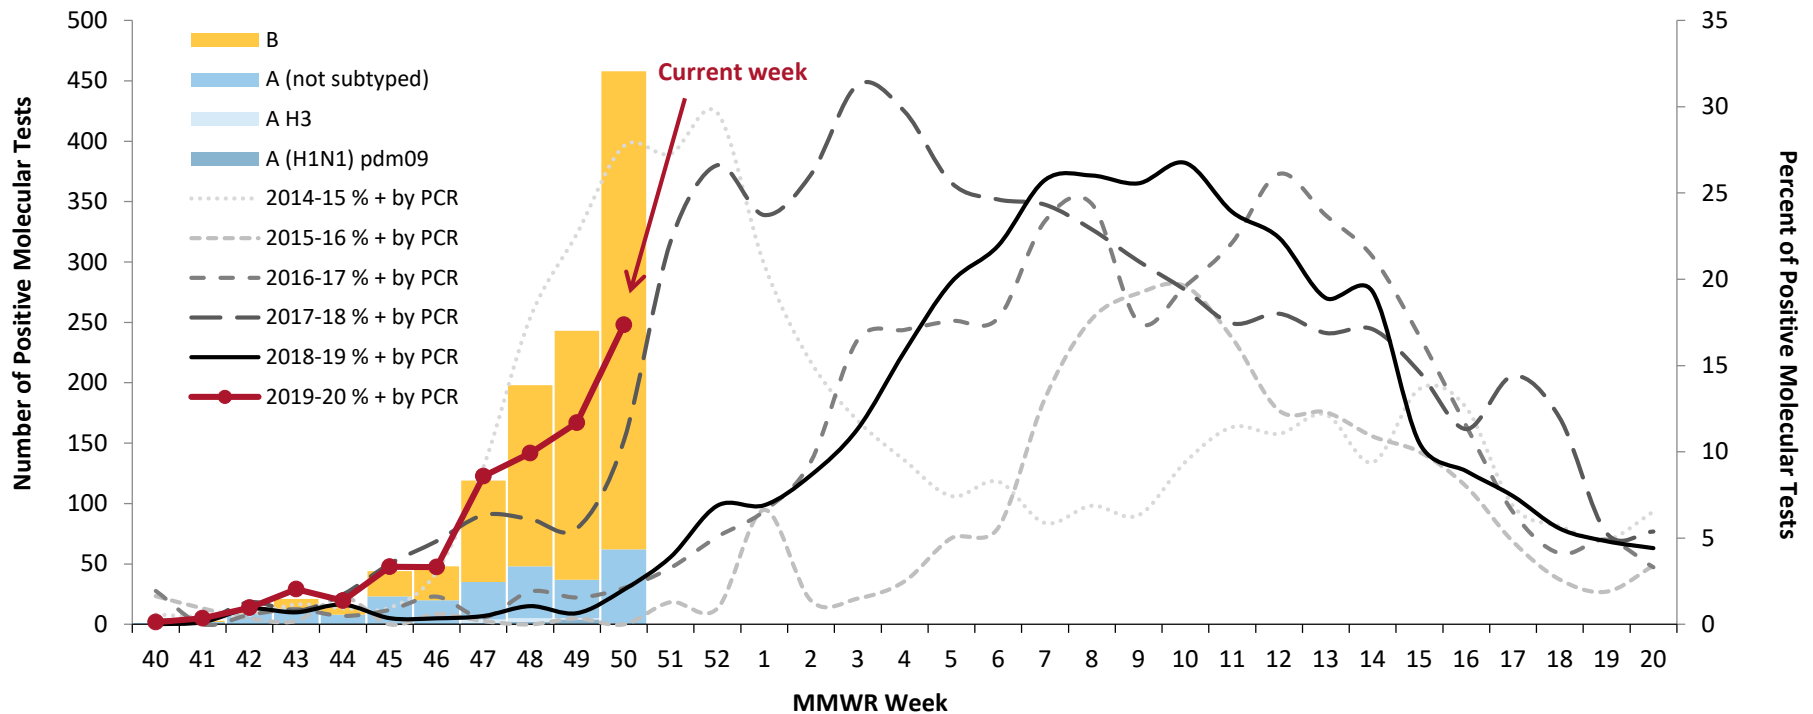

% of outpatients with ILI this week	% of outpatients with ILI last week
3.7%	3.3%

* Indicates current week-data may be delayed by 1 or more weeks

Laboratory Surveillance

The MN Lab System (MLS) Laboratory Influenza Surveillance Program is made up of more than 310 clinic- and hospital-based laboratories, voluntarily submitting testing data weekly. These laboratories perform rapid testing for influenza and Respiratory Syncytial Virus (RSV). Significantly fewer labs perform PCR testing for influenza and three also perform PCR testing for other respiratory viruses. MDH-PHL provides further characterization of submitted influenza isolates to determine the hemagglutinin serotype to indicate vaccine coverage. Tracking the laboratory results assists healthcare providers with patient diagnosis of influenza-like illness and provides an indicator of the progression of the influenza season as well as prevalence of disease in the community.

Specimens Positive for Influenza by Molecular Testing*, by Week

% molecular tests positive this week

17.4%

% molecular tests positive last week

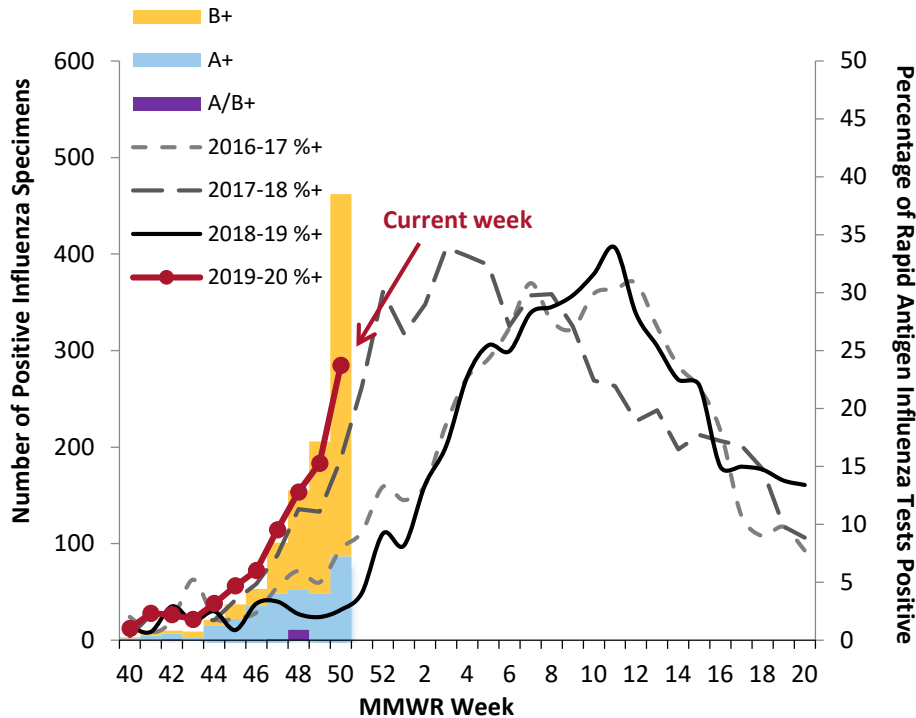

11.7%

* Beginning in 2016-17, laboratories report results for rapid molecular influenza tests in addition to RT-PCR results

Laboratory Surveillance (continued)

MLS Laboratories – Influenza Testing

Specimens Positive by Influenza Rapid Antigen Test, by Week

Region	% rapid antigen influenza tests + (current week)
Central	20%
Metro	25%
Northeast	16%
Northwest	36%
South Central	23%
Southeast	30%
Southwest	20%
West Central	33%
State (overall)	24%

MLS Laboratories – RSV Testing

Specimens Positive by RSV Rapid Antigen Test, by Week

Region	% rapid antigen RSV tests + (current week)
Central	24%
Metro	27%
Northeast	18%
Northwest	0%
South Central	0%
Southeast	44%
Southwest	27%
West Central	0%
State (overall)	25%

Hospitalized RSV Surveillance

Surveillance for respiratory syncytial virus (RSV) began in September 2016. Hospitalized inpatients of all ages who reside in the 7-county Twin Cities metropolitan area (Anoka, Carver, Dakota, Hennepin, Ramsey, Scott, and Washington) with laboratory-confirmed RSV are reportable. **Due to the need to confirm reports and reporting delays, consider current week data preliminary.**

49

Hospitalizations last week

61

Total hospitalizations

247

Median age at time of admission

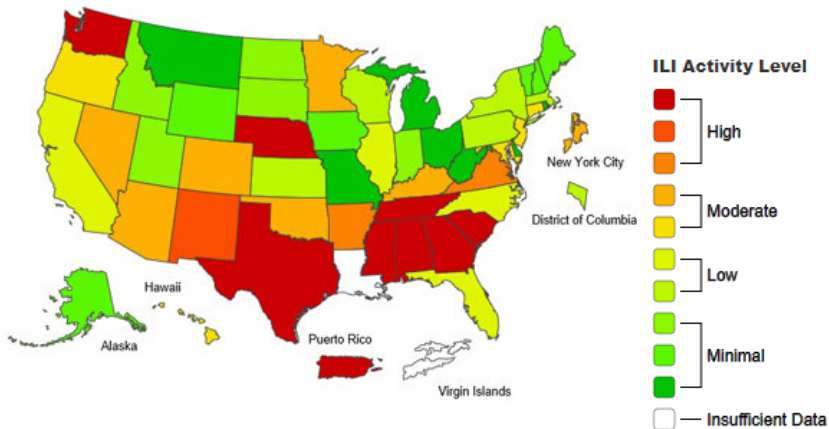

7.5 months

Weekly U.S. Influenza Surveillance Report

2019-2020 Influenza Season Week 49, ending December 7, 2019

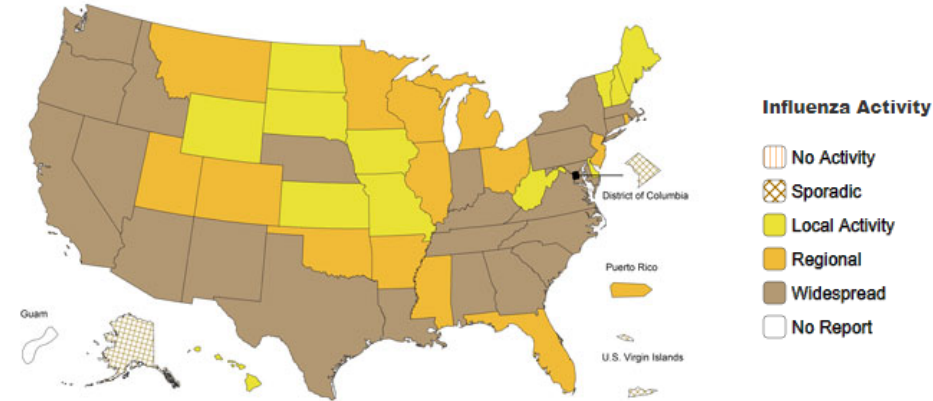

Seasonal influenza activity in the United States has been elevated for five weeks and continues to increase.

Influenza-Like Illness (ILI) Activity: Outpatient Illness

The number of jurisdictions experiencing high ILI activity decreased to 12 this week compared to 13 last week. In addition, 12 jurisdictions had moderate activity compared to 15 last week.

Geographic Spread of Influenza

The number of jurisdictions reporting regional or widespread activity increased to 38 this week from 30 last week.

Key Messages from CDC

- Activity is being caused mostly by influenza B/Victoria viruses, which is unusual for this time of year. A/H1N1 viruses are the next most common and are increasing in proportion relative to other influenza viruses in some regions.
- CDC estimates that so far this season there have been at least 2.6 million flu illnesses, 23,000 hospitalizations and 1,300 deaths from flu.
- It's not too late to get vaccinated. Flu vaccination is always the best way to prevent flu and its potentially serious complications.
- Antiviral medications are an important adjunct to flu vaccine in the control of influenza. Almost all (>99%) of the influenza viruses tested this season are susceptible to the 4 FDA-approved influenza antiviral medications recommended for use in the U.S. this season.
