

## Percentages of people with HIV engaged in selected stages of the care continuum, Minnesota, 2020

<sup>a</sup>Defined as people undiagnosed (estimate 1,200 (530-1,800), 95% CI) and people diagnosed (n=9,185) aged 13 or more with HIV infection (regardless of stage at diagnosis) through year-end 2019, who were alive at year-end 2020.

<sup>b</sup>Defined as people diagnosed aged 13 or more with HIV infection (regardless of stage at diagnosis) through year-end 2019, who were alive at year-end 2020.

<sup>c</sup>Calculated as the percentage of people linked to care within 30 and 90 days after initial HIV diagnosis during 2019. Linkage to care is based on the number of people diagnosed during 2019 and is therefore shown in a different color than the other bars with a different denominator.

<sup>d</sup>Calculated as the percentage of people who had  $\geq 1$  CD4 or viral load test results during 2020 among those diagnosed with HIV through year-end 2019 and alive at year end 2020.

<sup>e</sup>Calculated as the percentage of people who had suppressed viral load ( $\leq 200$  copies/mL) at most recent test during 2020, among those diagnosed with HIV through year-end 2019 and alive at year end 2020.

<sup>†</sup>Calculated as number of people who had suppressed VL ( $\leq 200$  copies/mL) at most recent test during 2020, among those who were retained in care during 2020 (5,921/6,572).
