Tuberculosis (TB) Risk Assessment

CHILD AND TEEN CHECKUPS (C&TC) FACT SHEET FOR PRIMARY CARE PROVIDERS

C&TC Requirements

General

A risk assessment for exposure to tuberculosis (TB) is required for every child receiving a C&TC visit. For more information refer to the MDH updated 2019 TB guidelines.

TB screening is only recommended for high-risk children.

Personnel

TSTs should be performed, read and recorded by health care workers trained in the administration and interpretation of TSTs.

A licensed, trained health care worker can draw TB blood tests. A licensed health care provider must complete result interpretation and follow-up.

Documentation

Document the TB risk assessment result. If positive for risk of TB exposure, document the screening test ordered and completed. The results, when available, must be documented in the patient’s record.

Procedure

Risk assessment

A risk assessment tool that may be used is the Minnesota Department of Health (MDH) Pediatric Tuberculosis (TB) Risk Assessment.

Screening with TB blood test (IGRA)

Screening with TB Skin Test (TST)

Tuberculin skin tests (TST) is an acceptable alternative if a TB blood test (Interferon gamma release assay or IGRA) is unavailable, too costly, or too burdensome, such as mass screenings and employment screenings.

TSTs are recommended for children under 2 years of age. A positive TST at any age is considered valid. For children 6 months of age and older, a negative TST is considered valid. TSTs may be used for children < 6 months of age, however, a negative TST result in a child of this age is unreliable. MDH recommends repeating an initial negative TST in an infant after the child reaches 6 months of age.

For detailed information on administration, refer to MDH’s Tuberculin Skin Test (TST) (www.health.state.mn.us).

Follow up

A positive TST or IGRA indicates a likely TB infection. A licensed health care professional must differentiate between latent tuberculosis infection (LTBI), which is non-contagious but still requires treatment, and active TB disease. Further medical evaluation includes a complete history, targeted physical examination, chest radiograph and, if indicated, sputum cultures.

For further clarification of LTBI versus TB disease, refer to the CDC’s Basic TB Facts (www.cdc.gov).

Reporting

Confirmed or suspected cases of active TB disease must be reported to MDH within one...
TB RISK ASSESSMENT

working day of identification. Both pulmonary and extra pulmonary forms of TB disease are reportable.

Call or fax reports to the MDH TB Prevention and Control Program (651) 201-5414 or (877) 676-5414. Do not wait for culture confirmation before reporting TB. MDH provides more information about reporting tuberculosis (www.health.state.mn.us).

Importance of TB risk assessment

In 2017, 178 new cases of active TB were reported in Minnesota (MDH). Young children are more likely than older children and adults to develop life-threatening forms of TB disease (CDC).

Professional Recommendations

American Academy of Pediatrics

Recommendations for Pediatric Preventive Health Care (www.aap.org) indicates risk assessment for TB exposure, followed by appropriate action, at the first health care encounter with a child, at 6 months of age and annually at well-child care visits from 12 months through 20 years of age.
