

# DOS & DON'TS

of Pulse Oximetry Screening

D<sub>0</sub>s

**DON'TS** 

Screen while the newborn is awake and calm, if possible. Use a new, clean sensor for each infant.

# **DO**

Make sure that the skin is clean and dry before placing the sensor on the newborn. It is okay to screen even if the infant is jaundiced.

### **DO**

Use the best sites for screening, which is around the right hand and either foot.

## **DO**

Align the emitter with the detector.

Use the confidence indicators to ensure an accurate reading.

### DON'T

Ever use an adult pulse ox clip to screen an infant.

### **DON'T**

Attempt to obtain a reading on the same extremity that a blood pressure cuff has been placed.

# **DON'T**

Perform the screen in bright or infrared light. It is okay to cover the sensor with a blanket to block the light in order to ensure accuracy.

## **DON'T**

Use tape or your own hand to hold the sensor against the infant's skin.
